# AUV : Autonomous Underwater Vehicle

# AUV-Based Ocean Survey

## ▲ Advantages

- free from the risk in human life
- low operation cost
- unconstrained motion

## ▲ Challenges

- unable to operate remotely in a real-time manner
- requires highly sophisticated autonomy

⊕ An AUV operates independently from the ship and has no connecting cables whereas ROVs are connected to an operator on the ship

ROV (Remotely Operated Vehicle)

# Navigation, Guidance, and Control

## Control

- ⊕ Navigation refers to the process to find the present and future position of a vehicle
- ⊕ Guidance refers to the process to define a path to move a vehicle from one point to another
- ⊕ Control refers to the process to maintain a vehicle to follow the prescribed path and attitude

# Bottom Survey using AUVs

- Accessible to the Bottom

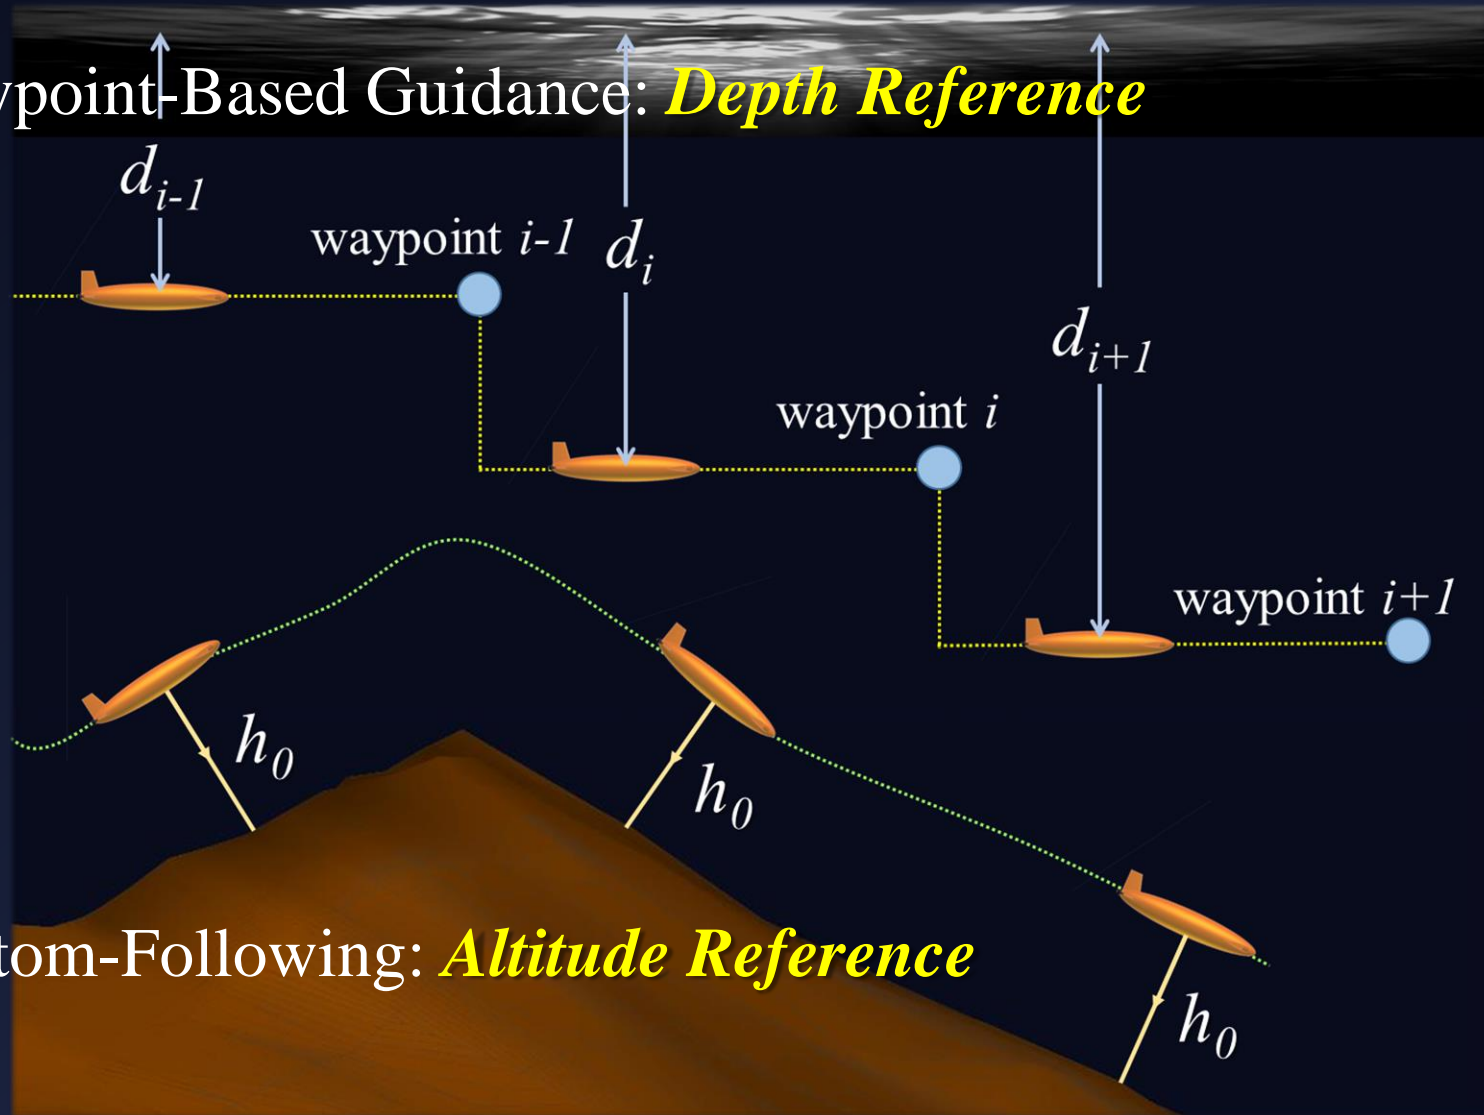

- Active Attitude Control

Low-altitude dive is essential for collecting high-grade survey data

# Basic Strategies for AUV-Based Bottom Survey

- Waypoint-Based Guidance: *Depth Reference*

- Bottom-Following: *Altitude Reference*

# Steep, Uneven Sea Bottoms

➔ Many places of scientific or economic importance are located in steep terrains !

# Sources of Bottom Collision of a Cruising AUV

- steep terrain
- limits in vehicle dynamics
- **unreliable information on the bottom**

## • r2D4 Dive in NW Rota-1

Google earth

Submarine volcano  
"NW Rota-1"

Northern Mariana Islands

北マリアナ諸島

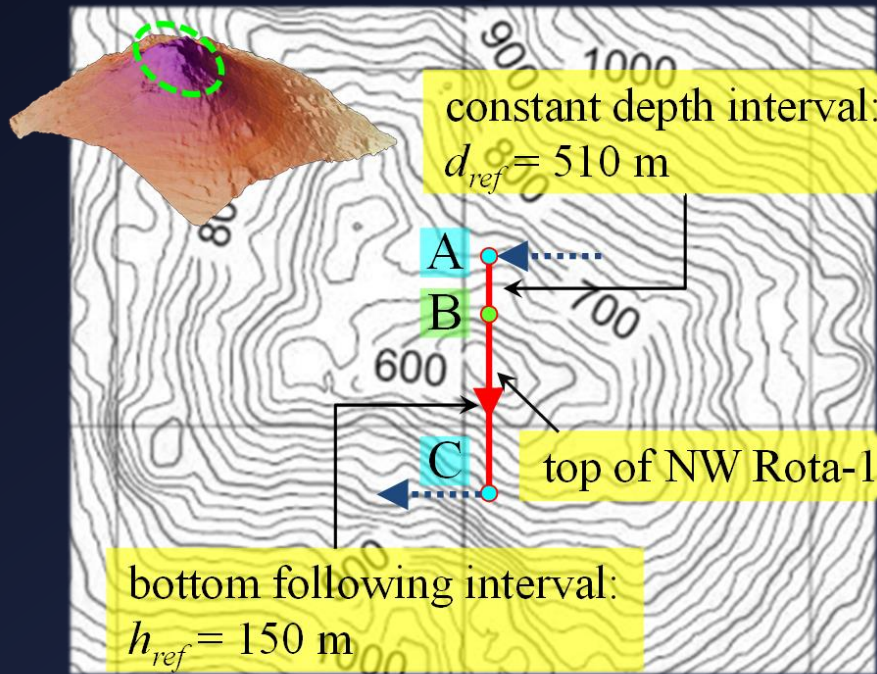

Cruising AUV r2D4 (IIS, The Univ. of Tokyo)

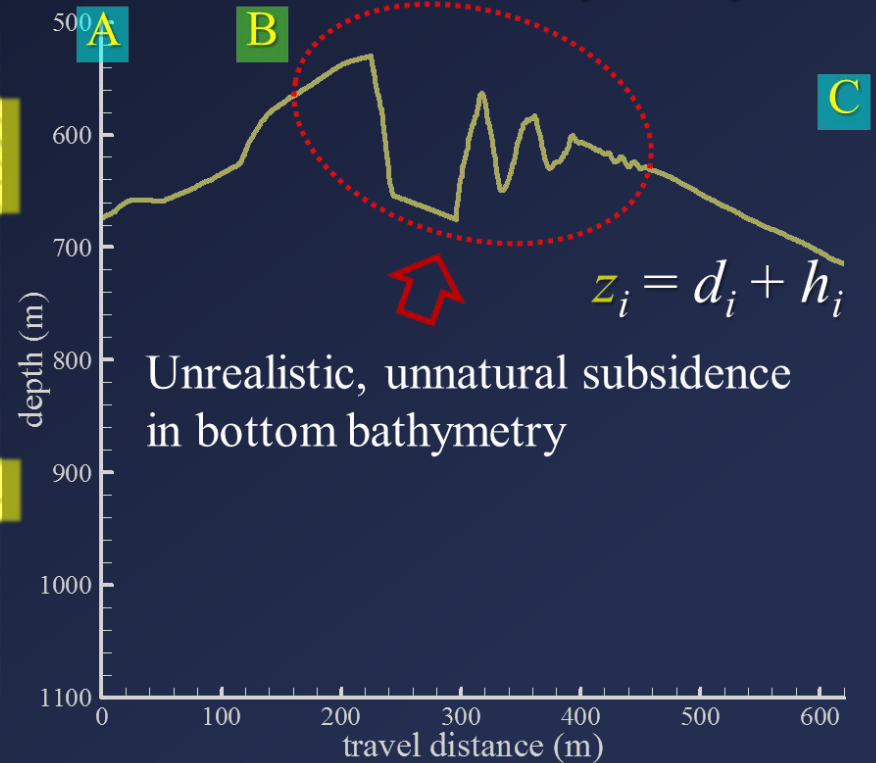

# Unrealistic Bottom Bathymetry

## Navigation

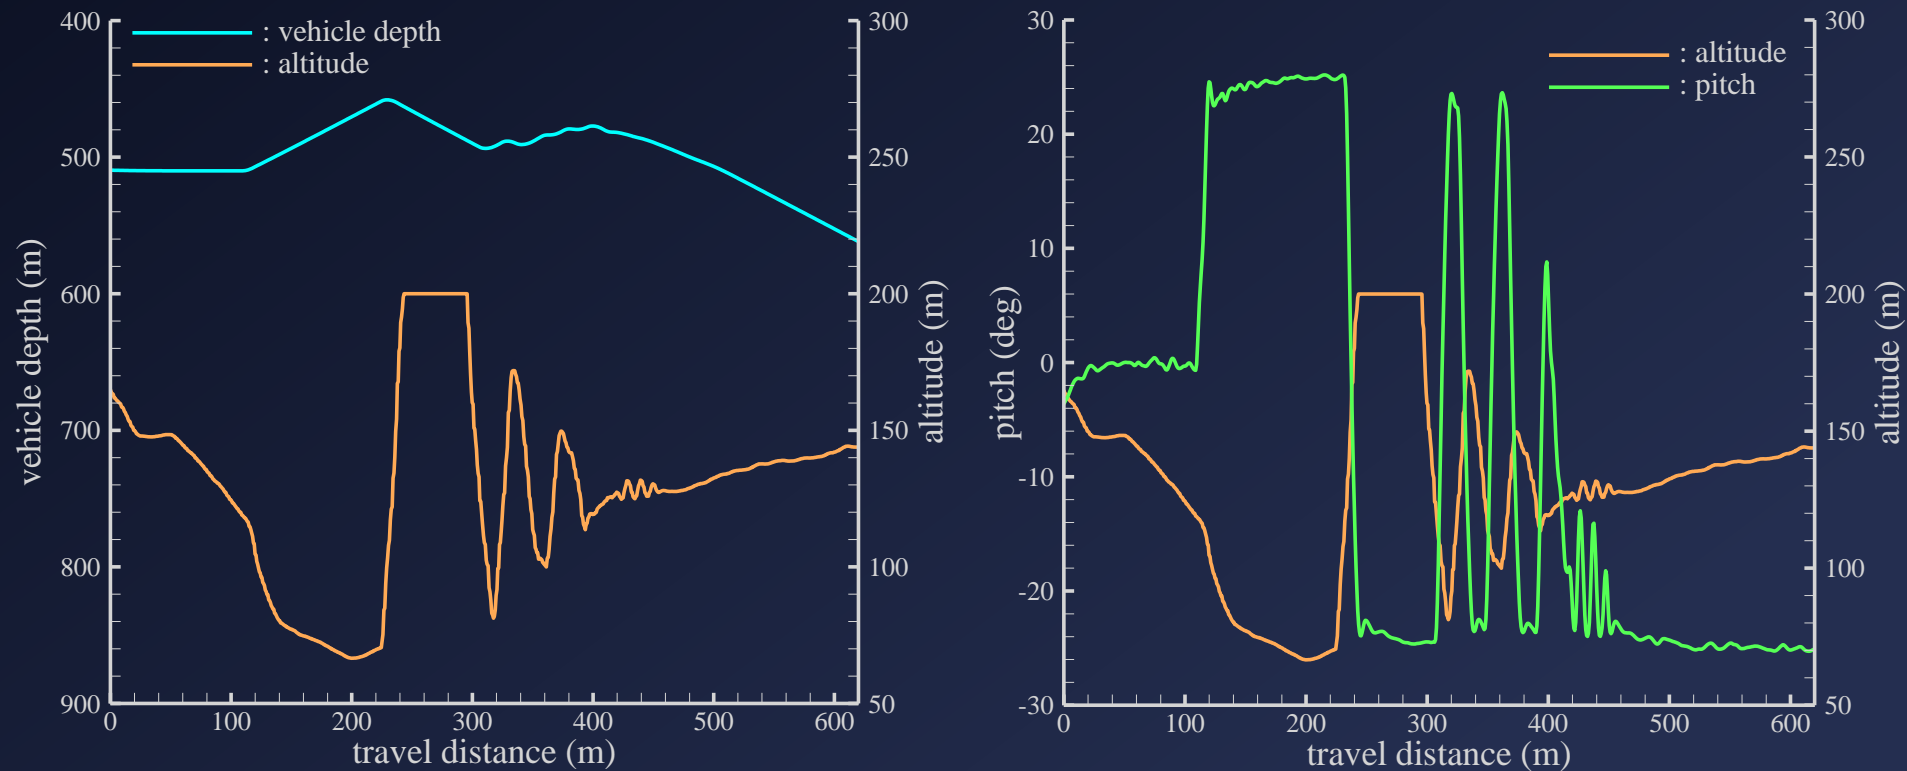

## Bottom Bathymetry

# Depth, Altitude, and Pitch

→ *Unrealistic altitude fluctuation*

→ *Depth and pitch also fluctuate, but are realistic*

# Dive Simulation

- model-based investigation of the motion instability

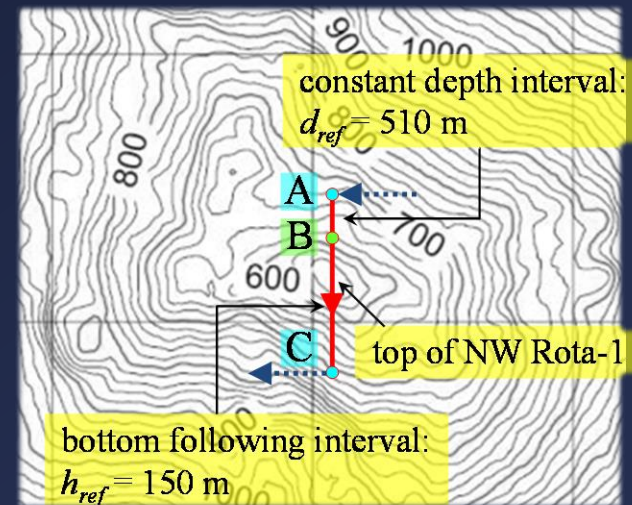

- Vehicle dynamics: *coupled longitudinal eq. of motion*

- Bottom geometry: *NW Rota-1*

- Navigation: *const. depth + bottom following (actual dive)*

## Underwater Acoustics

- Sonar equation: Receiver  $SNR = SL - 2TL - TS - NL$
- Transmission Loss ( $TL$ ):  $20\log_{10}R + \alpha R$
- Target Strength ( $TS$ ): ➔ **Angular** dependence of bottom scattering

$SL$ : Source Level  
 $NL$ : Noise Level

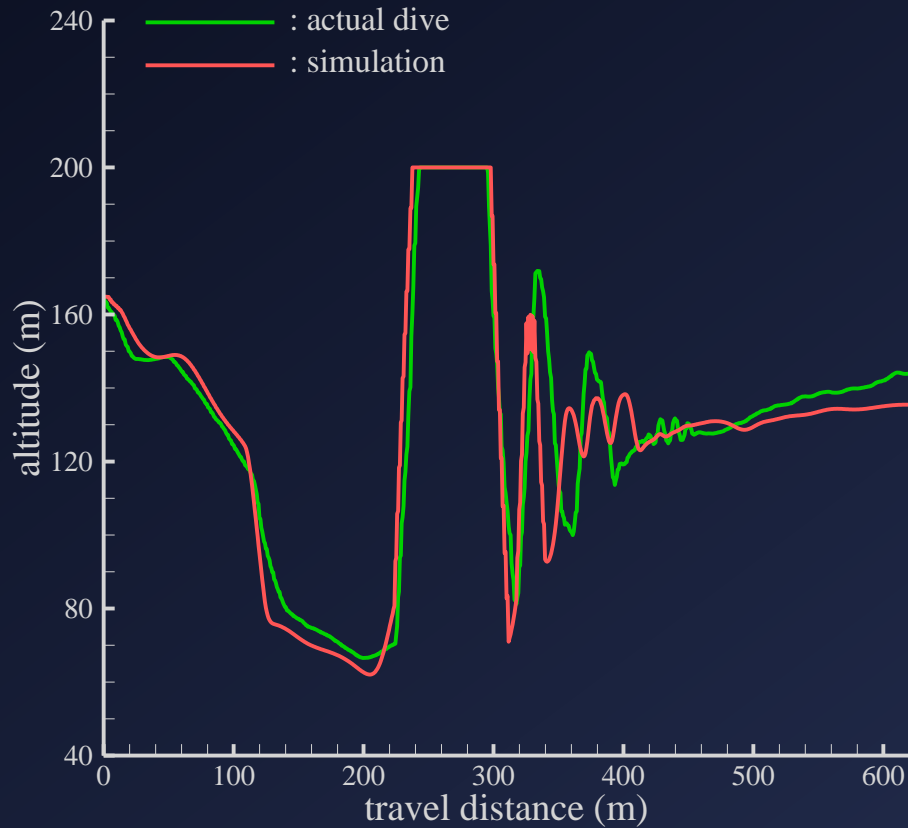

Altimeter (DVL)

- ❖ **Lost Bottom Lock**: receiver  $SNR <$  threshold  $SNR$   
state no longer able to provide any  
bottom-reference measurements

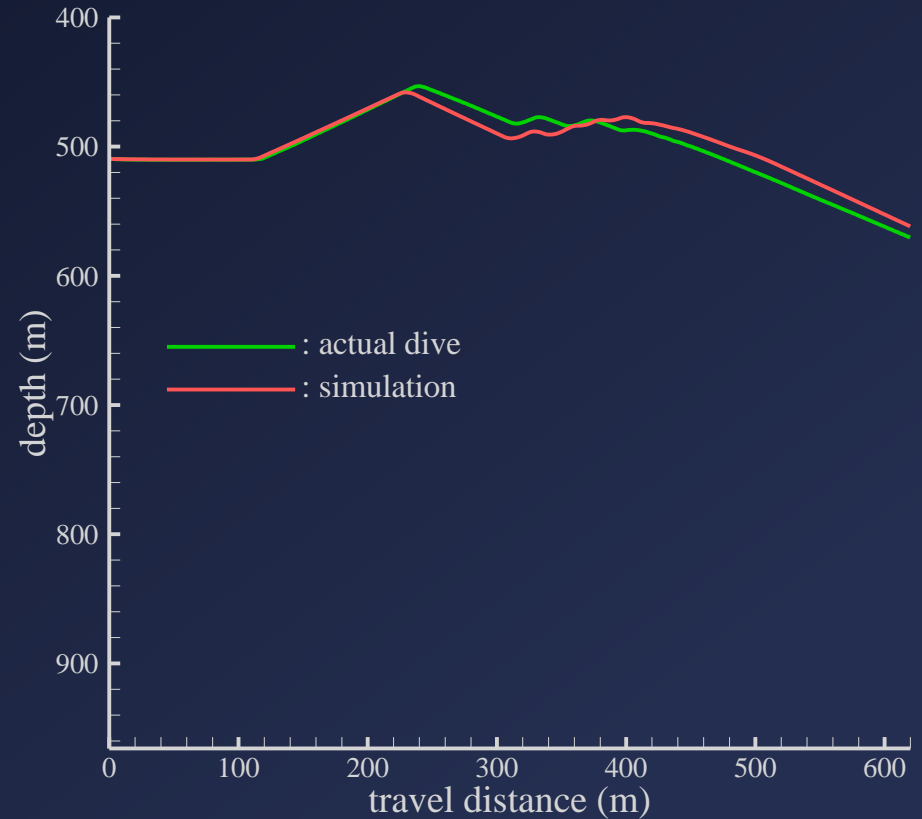

# Results of Dive Simulation

## • Altitude

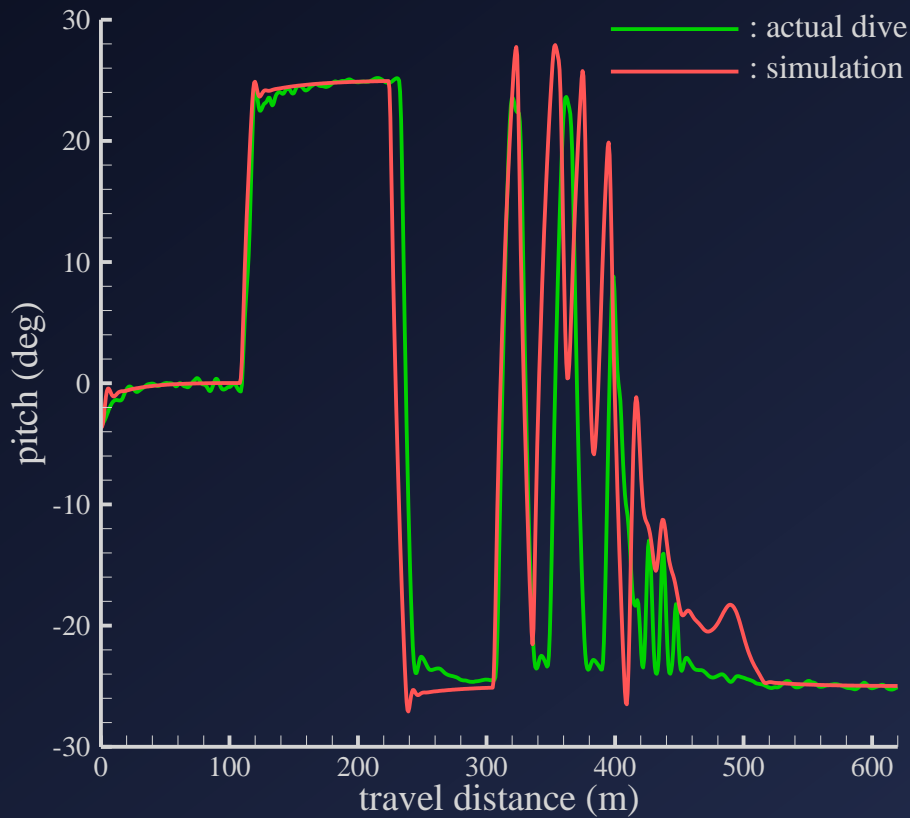

## • Vehicle depth

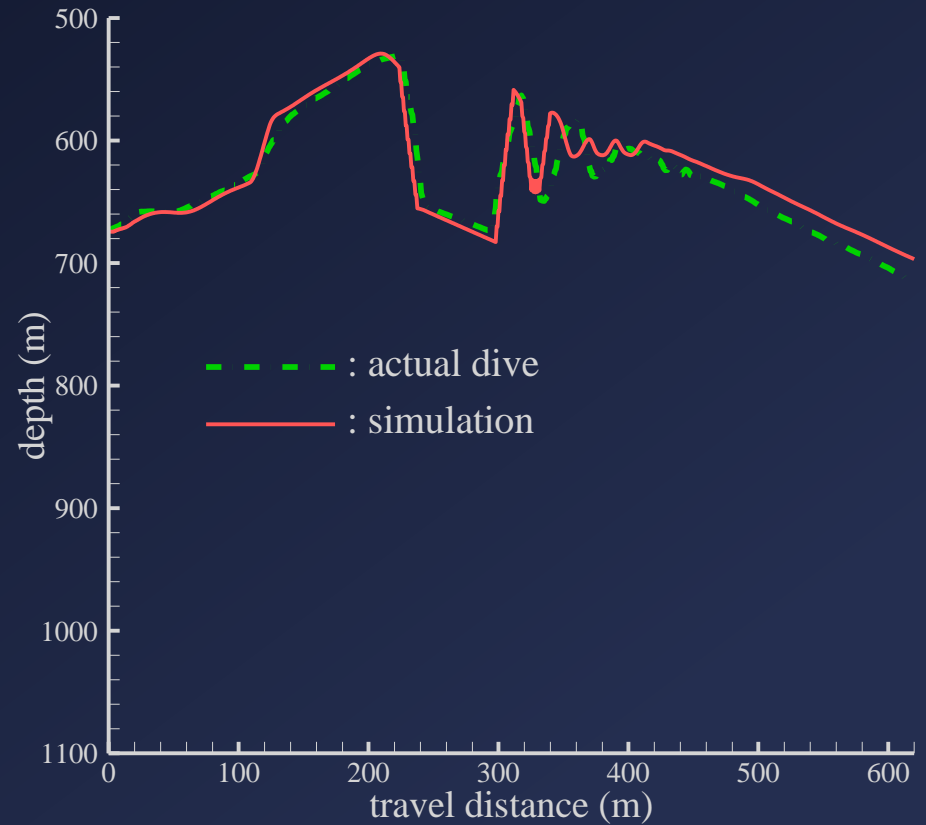

# Results of Dive Simulation

## • Pitch

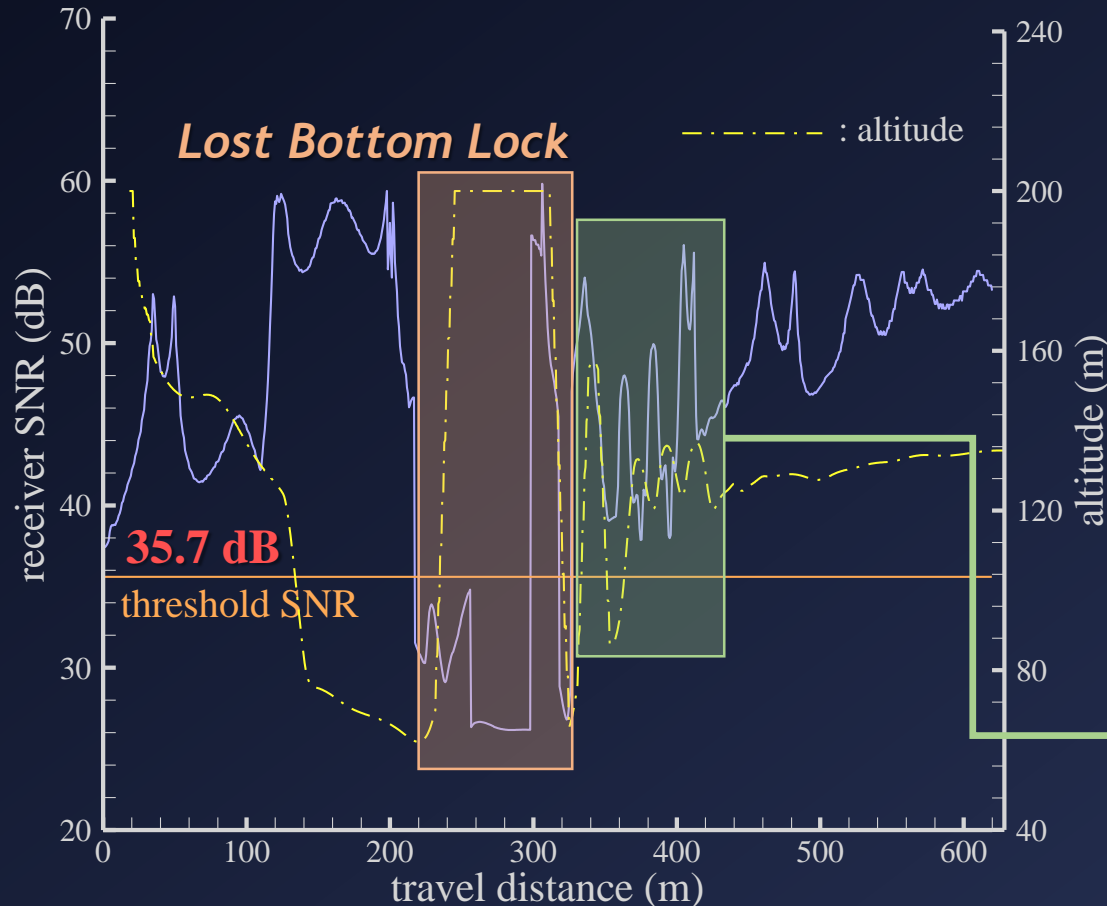

## • Bottom bathymetry

# Diagnosis

## • Simulated receiver SNR

## ▪ Lost Bottom Lock

➔ Angular dependence of bottom scattering

✓ 10-points moving average filter

✓ Default indicated altitude in case of lost bottom lock : 200 m

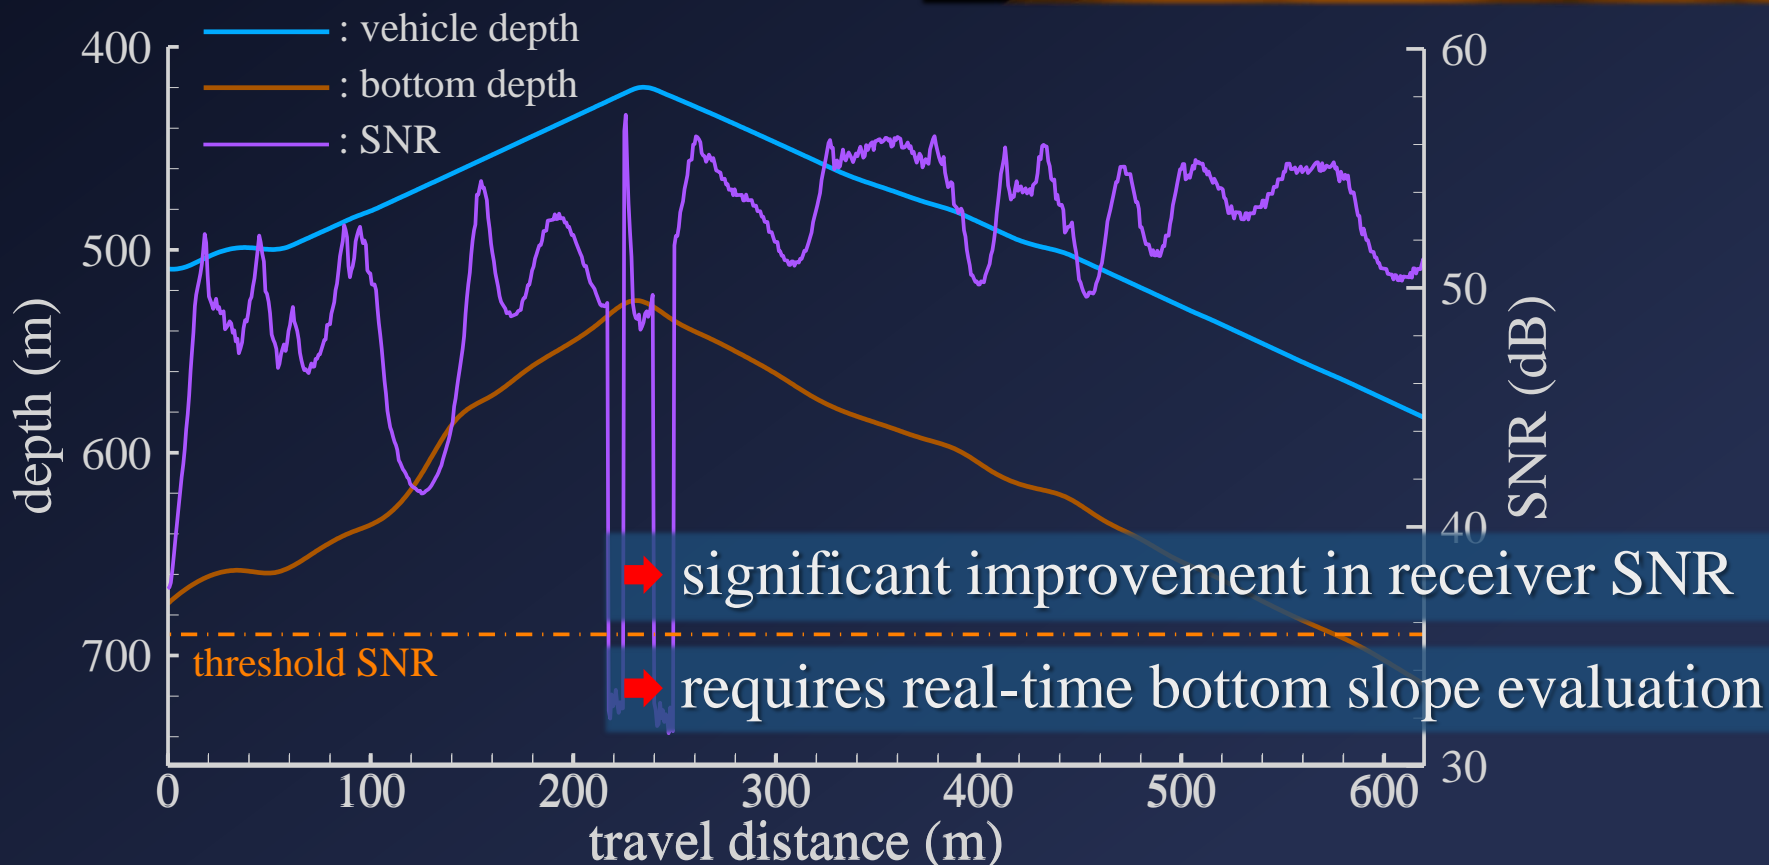

# ▪ Nodding Motion due to Altitude Overestimation

# Solutions

## ■ Slope-Following Dive

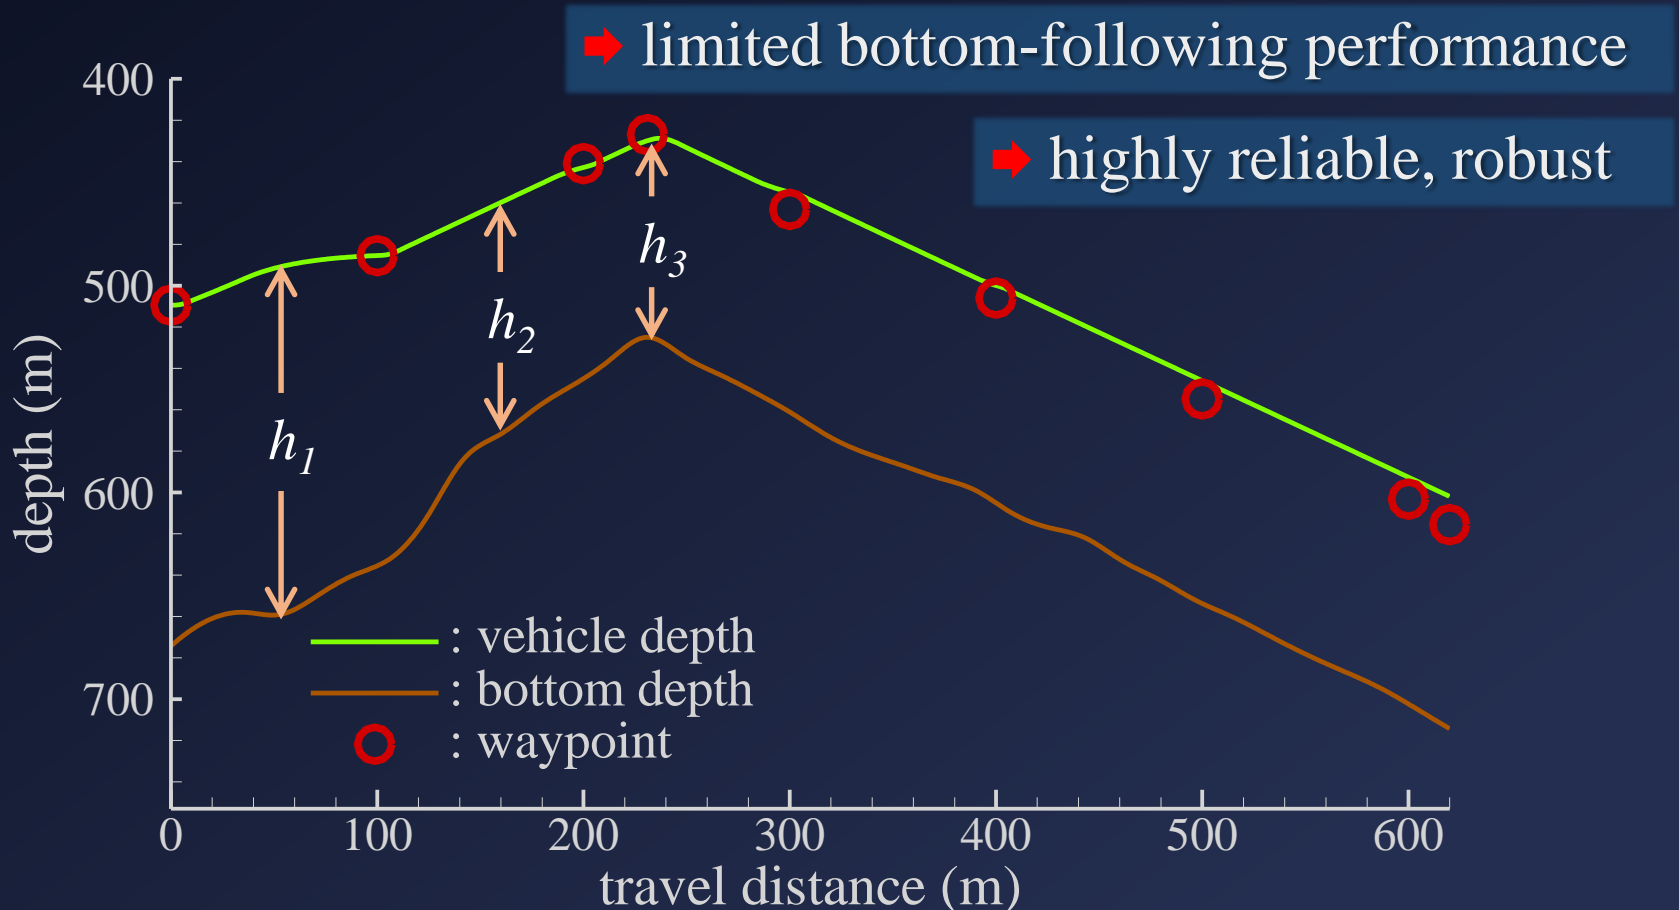

*control the pitch of a vehicle to coincide with the slope of sea bottom*

# Solutions

## ▪ Pseudo Bottom-Following Dive

- depth referencing waypoint-based guidance emulating bottom following

# Conclusions and Future Works

- Navigation of a cruising AUV over a Steep Terrain

- *vehicle safety*
- *low altitude access*
- *attitude stability*

*cannot be satisfied by conventional depth or altitude based navigation*

- Terrain-Adaptive AUV Navigation

- *Slope-Following Dive*
- *Pseudo Bottom-Following Dive*
